PROFESSIONAL SUMMARY

I'm a Flutter developer with around 3 years of experience building Android and iOS apps, including two currently live in production on the App Store and Google Play. My core stack is Flutter/Dart with Bloc/Cubit, Dio for API integration, and Arabic/English (RTL) localization built on shared themes and reusable components I carry between projects.

My work focuses on HR/attendance, logistics/delivery, and enterprise ERP apps, including full ownership of a multi-module ERP system built end-to-end. I'm most comfortable with the harder features: real-time tracking and maps, biometric face and liveness verification, and offline-first flows that stay correct when the network is unreliable. Since June 2026 I've been working beyond the mobile side as well — backend development with C#/ASP.NET Core (ABP Framework), from production bug fixes to building services — which has made me sharper about how the mobile and server sides fit together. I care most about the less glamorous side of shipping: solid validation, error handling, and the production debugging that keeps releases stable.

WORK HISTORY

Full-Stack Mobile Developer

Advanced Achievement Company for Information Technology Ltd. | 06/2026 – Current | Baghdad, Iraq

- In addition to my mobile role, started backend development with C#/ASP.NET Core (ABP Framework) in June 2026.
- Took over the Noon Express backend, debugging and fixing production issues.

Mobile Application Developer

Advanced Achievement Company for Information Technology Ltd. | 10/2025 – Current | Baghdad, Iraq

- Develop and maintain Flutter apps for a large, multi-module enterprise ERP suite (Inventory, Finance, HR, Point of Sale, and more) used by Arabic- and English-speaking staff, with full RTL support.
- Built the biometric attendance flow: on-device face detection and liveness checks (randomized head-turn / smile challenges), plus GPS capture with mock-location rejection, to help prevent spoofed photos and off-site check-ins (face matching handled server-side).
- Took over Noon Express, a live last-mile delivery app, after its initial release — implementing new features, refactoring the codebase, fixing production issues, and maintaining releases.
- Structure features around Bloc/Cubit and clean architecture (use-cases, repositories) to keep the codebase scalable and maintainable.
- Integrate REST APIs with Dio, implementing interceptors, JWT token refresh, and standardized error mapping shared app-wide.
- Build responsive UIs on a shared light/dark theming system and a reusable component library to speed up delivery of new screens.
- Partner with backend and QA to ship stable releases, and support production by analyzing logs, reproducing issues, and delivering fixes.

EDUCATION

Bachelor of Informatics Engineering

Al Sham Private University | 02/2019 – 01/2024 | Damascus, Syria

- Software development, programming fundamentals, object-oriented programming, database design, web development, mobile application development, computer networks, operating systems, software engineering, systems analysis and design, and problem-solving skills.
- Field of study: Informatics Engineering | Website: aspu.edu.sy

LANGUAGES

Mother tongue(s): Arabic
Other language(s): English

PROJECTS

Noon Express Mobile App (Flutter — Full-stack)

11/2025 – Current

Noon Express — a live last-mile delivery and freight app, published on both the App Store and Google Play. I joined after the initial release and continued its development: implementing new features, refactoring the codebase, fixing production bugs, and publishing updates to the App Store and Google Play. The app serves merchants, delivery drivers, and back-office staff from a single Flutter codebase, covering shipment management, QR/barcode scanning, real-time parcel tracking on maps, returns, driver settlements, and push notifications, with full Arabic/English (RTL) localization. Built with Bloc/Cubit state management, Dio for REST APIs, SignalR for live tracking, and Firebase Cloud Messaging for notifications. Recently I also took over the app's backend, debugging and fixing production issues.

ENKI ERP — Cross-Platform Mobile Suite (Flutter)

11/2025 – Current

Cross-platform Flutter client for ENKI ERP, a modular enterprise system, published on Google Play and the App Store. Built and shipped all 9 modules end-to-end — Finance, HR/Attendance, Point of Sale, Inventory, Purchasing, Sales, Manufacturing, and Archive — on a shared, layered architecture (Bloc/Cubit, use-cases, repositories, Dio). The Attendance module includes on-device face detection and liveness detection (randomized head-turn / smile challenges) and GPS capture with mock-location rejection — with face matching handled server-side — to help prevent spoofed photos and off-site check-ins.

Store Management System — Flutter + .NET (Full-stack)

06/2026 – Current · In development

Cross-platform store management app with its own backend, built end to end. The Flutter app lets store owners manage products with size/colour variants, categories, inventory, and the full order lifecycle — feature-based clean architecture (Cubit, repositories/use-cases, get_it), Dio with Hive caching, OTP phone authentication, Firebase push notifications, and Arabic/English/Bengali localization with RTL. The backend is C#/ASP.NET Core (.NET 10) on the ABP Framework with a domain-driven layered architecture: auditable stock-movement history, an order create–confirm–cancel lifecycle with automatic stock deduction, multi-method payments, and OpenIddict/JWT authentication — backed by EF Core and xUnit tests.

Warehouse Management Mobile App (Flutter)

07/2026 – Current · In development

Building a cross-platform mobile app in Flutter/Dart (currently in development, not yet released) that lets third-party logistics teams run warehouse operations from their phones, connecting to an ERP backend over a REST API. It covers the full inbound/outbound flow — stock-in and stock-out order creation, tracking, and updates — with item, unit-of-measure, and organization lookups feeding order entry, plus authentication (email and Google sign-in) and Firebase push notifications. The codebase follows clean architecture with a Cubit/Bloc state layer and dependency injection, keeping features as self-contained vertical slices. The app is Arabic-first

with full right-to-left support and English localization, and ships a custom design system for consistent theming across screens.

Freight & Shipping Mobile App (Flutter)

07/2026 – Current · In development

Building a cross-platform mobile app (currently in development, not yet released) for a freight logistics platform, covering the full shipment lifecycle: user registration, OAuth login, shipment booking, and real-time tracking through a live status timeline. It includes barcode/QR scanning for parcel lookup and map-based location display for shipment routing. The app integrates with a .NET (ABP) backend over REST, using token-based authentication and multi-tenant request handling, structured in a clean, layered architecture (Cubit/Bloc, use-cases, repositories, data sources) to keep business logic testable and isolated. Bilingual (Arabic/English) with RTL support and custom light/dark theming.

SKILLS

Languages: Dart

Mobile: Flutter, Android, iOS, Cross-platform development, Responsive UI (flutter_screenutil)

State Management & Architecture: Bloc/Cubit, Clean/layered architecture, Use-cases & repositories, Dependency injection (get_it), GetX

API & Data: REST API integration, Dio, JSON serialization, Pagination, Local storage (Hive), Offline-first & caching, JWT auth & token refresh

Device & Platform Features: Camera & image capture, Google ML Kit (face detection), Biometric verification & liveness detection, Geolocation, maps & real-time tracking, Local/push notifications, Permissions handling, Platform channels (native integration)

UI/UX: Design systems & theming, Reusable component libraries, Localization & RTL (Arabic/English), SVG & animations, Loading/skeleton states

Backend (.NET): ASP.NET Core (ABP Framework), EF Core, SignalR, xUnit, JWT, OpenIddict
